Interview Questions for Desktop Support Technician/Analyst

General Questions

Q. What desktop operating systems are you familiar with?
A. Before you answer this question, you should have some background information on what operating systems are used within the organization you are interviewing with. Undoubtedly, you will be asked to elaborate on your skill set with each of these operating systems so it's best to tailor your elaboration to the operating systems that are relevant to the hiring manager. This being said, don't leave out mentioning experience in other operating systems. You never know whether the company may be evaluating the migration to a different OS.
Q. Have you used imaging software before? How do you find these tools useful?
A. Automation tools are an important part of your job as a desktop support technician. Elaborate on the tools that you've used. Hiring managers want to assess your in-depth knowledge and experience with using these tools. This means talking about how you use their various feature sets. (If you have an opinion, you probably know the product pretty well.)
Q. What are the pitfalls of using imaging software?
A. This question is meant to assess how well you know these products. For example, discussing the importance of testing the image demonstrates that you use these tools on a regular basis.
Q. Have you used any software distribution tools? If so, which ones and how were they used?
A. Like imaging software, software distribution tools are an important part of your job. Hiring managers are looking for knowledge that these tools exist and how they can be used to support your organization.
Q. What do you like most about desktop support?
A. Hiring managers are looking for what motivates you. Hopefully your answer will match the characteristics of the job: being busy, working with different people, and the challenges of learning new operating systems and configurations.
Q. What do you like least about desktop support?
A. The hiring manager is testing whether you will fit in with the existing team. An appropriate answer here would be not being able to resolve a problem in a timely manner for reasons outside your control, such as hardware failure. Stick to things outside of your control for the best response.
Q. When solving a desktop problem, do you prefer to work with the end-user, your peers, or on your own?
A. This is another question to determine your fit within the organization. Hiring managers understand that to be successful as a support technician you will have to work in a team environment. This means working with other employees, vendors, and end-users on a constant basis.
Q. Can you describe a situation where you have had to deal with a difficult person? How did you handle it? Would you do anything differently?
A. Desktop support can be very demanding some days. End-users only see their own priority needs and often are not interested in other demands on your time. This question explores how you deal with a difficult end-user by understanding their problem, assessing priorities, and communicating a timeframe for resolution. Often good communication can help both sides come to an agreement. Make sure you have an example with a successful outcome.
Q. How would you say you are able to handle stress?
A. Hiring managers are looking to see what coping techniques you can draw on to deal with stress. Sometimes from the answer, they can also determine whether you are prone to stress. When responding, some techniques for handling stress that you may want to talk about include continually evaluating what's on your plate and prioritizing, communicating

Active Directory in Windows Server 2003

The Active Directory is the one of the important part of Windows Server 2003 networking .First need to know and understand Active directory. How does it work? It makes information easy for the administrator and the users. You can use the Active Directory to design an organization's structure according to the requirement. If you are using the Active Directory then you can scale active directory from a single computer to a single network or too many networks. In active directory you can include every object server and domain in a network.

Logical Component

In the organization you set up in Windows Server 2003 and the organization you set up in Exchange Server 2003 are the same and the same is the case with Windows 2000 and Exchange 2000 as well. Now I am going to tell you its advantage one user administrator manage all aspects of user configuration. These logical constructs which are described in the following subsections allow you to define and group resources so that they can be located and administered by the name rather than by physical location.

Objects

Object is the basic unit in the Active Directory. It is an apocarpous named set of features that represents something adjective such as a user, printer and the application. A user is also an object. In Exchange a user's features include its name and location, surrounded by other things.

Organization Unit

Organization Unit is a persona in which you can keep objects such as user accounts, groups, computer, and printer. Applications and other (OU). In organization unit you can assign specific permission to the user's. Organization unit can also be used to create departmental limitation.

Learn about basic Active directory functionality. Happy learning!!!

What is Global Catalog and its function?

KCC
The KCC is a built-in process that runs on all domain controllers and generates replication topology for the Active Directory forest. The KCC creates separate replication topologies depending on whether replication is occurring within a site (intrasite) or between sites (intersite). The KCC also dynamically adjusts the topology to accommodate new domain controllers, domain controllers moved to and from sites, changing costs and schedules, and domain controllers that are temporarily unavailable.

How do you view replication properties for AD?
By using Active Directory Replication Monitor.
Start–> Run–> Replmon

What are sites What are they used for?
One or more well-connected (highly reliable and fast) TCP/IP subnets. A site allows administrators to configure Active Directory access and replication topology to take advantage of the physical network.

Name some OU design considerations?
OU design requires balancing requirements for delegating administrative rights – independent of Group Policy needs – and the need to scope the application of Group Policy. The following OU design recommendations address delegation and scope issues:
Applying Group Policy An OU is the lowest-level Active Directory container to which you can assign Group Policy settings. Delegating administrative authority usually don't go more than 3 OU levels

Logical Diagram of Active Directory ?, What is the difference between child domain & additional domain Server?
Well, if you know what a domain is then you have half the answer. Say you have the domain Microsoft.com. Now microsoft has a server named server1 in that domain, which happens to the be parent domain. So it's FQDN is server1.microsoft.com. If you add an additional domain server and name it server2, then it's FQDN is server2.microsoft.com.
Now Microsoft is big so it has offices in Europe and Asia. So they make child domains for them and their FQDN would look like this: europe.microsoft.com & asia.microsoft.com. Now lets say each of them have a server in those child domains named server1. Their FQDN would then look like this: server1.europe.microsoft.com & server1.asia.microsoft.com..
